개념 설명

삼각형의 높이

그림

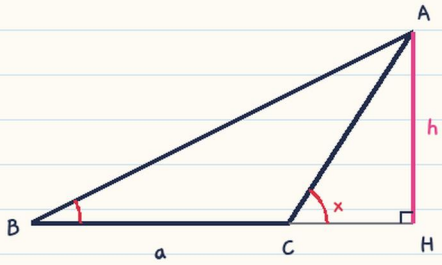

$\overline{BH} = h\tan\alpha$, $\overline{CH} = h\tan\beta$

$h\tan\alpha + h\tan\beta = a$

$$(1)\quad h = \frac{a}{\tan\alpha + \tan\beta} = \frac{a}{\tan(90^\circ - B) + \tan(90^\circ - C)}$$

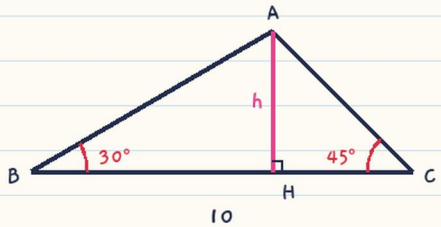

그림

$h\tan\alpha - h\tan\beta = a$

$$(2)\quad h = \frac{a}{\tan\alpha - \tan\beta} = \frac{a}{\tan(90^\circ - B) - \tan(90^\circ - x)}$$

예

$\overline{BH} = h\tan 60^\circ$, $\overline{CH} = h\tan 45^\circ$

$h\tan 60^\circ + h\tan 45^\circ = 10 \quad \therefore\ h = \dfrac{10}{\tan 60^\circ + \tan 45^\circ}$
